Today’s Problem

How to Build Something Like this

Using some kind of approach like one of the following

Process model

1970’s

Requirements Spec.

Characteristics of System to be built must match required characteristics

Hi Level design must show HOW requirements can be met

Hi Level Design

Low Level Design

Test Results must match required behavior

Test Plan

Code

Test Plan exercises this code

Design

Requirements Spec.

Test Results must match required behavior

How to Build Something Like this

Using some kind of approach like one of the following

Process model

1970’s

Recognition of feedback loops

-Earliest design and test

• Earliest design and test

Feedback

Early prototyping

1970’s

Recognition of feedback loops

-Earliest design and test

Feedback

Early prototyping

order -- “what shall we do next?”

• transition criteria -- “how long shall we do it?”

Feedback

• Earliest design and test

Requirements Feedback

Architectural Design

Code

Test

order -- “what shall we do next?”

• transition criteria -- “how long shall we do it?”
Reusable based development

- New process
- Requires data store semantics

"Throwaway" prototyping

Evolutionary prototyping

The Rational Unified Process

- New semantics to show roles of agents

Boehm's Spiral Model

Different Traversals of the Spiral Model to address different risks
To the satisfaction of all of these?

Our Approach

- What is the goal/role of each component type?
- What is the nature of it?
  - Eg. what internal structure does it have?
- What sorts of stakeholders are interested in it?
- What sorts of questions do they generally have about it?
- What sorts of relations must it participate in?
  - Internal relations
  - External relations
- What sorts of processes deal with it?

Requirements Spec.

- Test Plan
  - Test Results must match required behavior
  - Test Plan exercises this code

Test Plan

Requirements Spec.

- Design
  - Characteristics of System to be built must match required characteristics
  - Hi Level design must show how requirements can be met

Design

Requirements Spec.

- Code
  - Code must implement design
  - Consistent views
  - Test Plan exercises this code

Code

Some Papers in Requirements Engineering

Requirements: Goals and Purposes

- Why “do requirements”?
  - Clarify needs before plunging into design
    - Customer “knows” what is wanted
    - But usually doesn’t know how to say it
    - Weak sense of what can be achieved
  - Clarify acceptance criteria
    - How to know it really delivers what was wanted
  - Serve as guide to developers, testers, customers, maintainers
    - “Baselining” requirements
Requirements Specification Driven By Stakeholders and their Questions

- Customers
  - What must it do?
- Developers (eg. designers)
  - What do I have to get it to do?
- Testers
  - What is it supposed to be doing?
  - How would I know it if I saw it?
- Users
  - What is it supposed to do?
- Regulators
  - Is enough being required?
- Others???
Requirements Specification Parts

Help stakeholders organize their thoughts about needs by decomposing requirements specification into categories needs and desires.

Some examples:

- Introduction/Background
- Functional
- Environmental
- Performance
- Accuracy
- Robustness
- Security
- Safety

Background/Introduction

Purpose: Give background/context out of which the problem arises, and directions in which it is likely to go

Should contain glossary, references

Should give intuition about problem, domain, existing solutions, components

Probably best written mostly in natural language

Example: UMass has 20,000 students, slow growth

next few years

Semester system

Existing system that works, but is not great

Define: FTE, fulltime load, etc.

Functional

Purpose: Indicate the functional transformations that the system will have to compute

Likely to be large and complex, therefore aids to easier and clearer comprehension are needed (eg. hierarchy)

Important to state WHAT the functions are and not HOW they are to be computed

Promising formalisms: dataflow diagrams, FSM’s

Usually the chief focus of a requirements specification, and of requirements formalisms—but non-functional requirements are often at least as important

Environmental

Purpose: Indicate the environment in which the software will have to operate

On which hardware and software will the software run?

With which other applications will it have to interface?

What will be the nature of the user community it will have to support?

With what other manual and automated systems will it have to interface correctly?

Example: System is to be interactive

Most users to be students

Must run using cellphones, PDAs

Must print reports on existing forms

Must interface successfully with existing student and administrative databases

Performance

Purpose: Specify how much computer and human resource can be allocated to support the execution of the software

How much computer memory can the software use?

How fast must response time be?

--average case

--worst case

How long will users wait for batch runs to terminate?

Example: 2 second response time

overnight printing of all reports

1 GBytes of memory available

500 GBytes of disk available

Accuracy

Purpose: Specify how much tolerance (if any) is acceptable in the results

Most important in numerical computations, but...

Often where "optimality" is defined

eg: what is a "good" game of chess?

Example: Reject scheduling constraints that cause more than 10% of all student requests to be denied
Robustness

Purpose: Specify what sorts of abuse the software will have to resist, and how it will respond
What kinds of "illegal" inputs might be expected, and what should be done about them?
Must the system fail safe, fail soft? When?
What abnormal environmental conditions might be expected?
Example: System must never corrupt any database
--even after a crash
System must deny illegal requests politely
System must not crash due to
--lack of storage
--user overload

Security

Purpose: Specify which users can do which things, and when
Usually there are classes of users--what are they?
How to distinguish among the users?
Matrix (?) to specify what accesses and permissions different classes and users will have?
Example: Students cannot:
--change course assignments
--cancel courses
--access data on others
Faculty cannot:
--cancel courses
--change course assignments
Faculty can: access any student data
Administrators can: .... do pretty much anything...

Safety

Purpose: Specify what hazards must be avoided
Specify what the software must NEVER be allowed to do
Has some elements of an inverse or negated set of requirements
Example: System must never corrupt student information database, or faculty personnel database

Not All Go Into All Requirements Specs.

- Some of these may be omitted; some emphasized/deemphasized
- Other sorts of requirements may be added/substituted
  eg: reliability, flexibility, portability......
- Requirements specification provides information needed to satisfy needs of all stakeholders
- Different stakeholder mixes determine choices of what goes into the requirements spec.
SOME EXAMPLES OF THESE UNDERLYING NEEDS:
  - Communication
  - Testability
  - Precision
  - Clarity
  - Completeness
  - Changeability

Requirement Specification Challenges

- Is it Complete? (to the extent required)
  --Ultimately impossible to be sure about this
- Is it Consistent? (no internal contradictions)
  --Many possible interpretations of this
- Is it unambiguous? (possible multiple interpretations)
- Is it sufficiently precise?
  --It is possible to be too precise too
- Is it Feasible?
  --If it asks the impossible it would be good to know it
- Is it Even? (consistent levels of detail)
- Is it Understandable? (what does that mean?)
  --by all stakeholder groups!
- Is there an implementation bias?
- Is there a good basis for proceeding to design?

A Requirement Specification Is Never Perfect in All (Any?) Aspects

- Imperfections are often understandable, tolerable, unavoidable
- Look at real underlying stakeholder needs for the requirements specification (communication, clarity, precision, modifiability....??)
- Plan requirements content, structure, relations to meet these needs
- Requirements specification medium is crucial in helping assure needs are met
- Select requirements specification medium to address needs
Requirements Specification

Formalisms and Processes

• Support addressing these challenges
• Different formalisms emphasize facilities for supporting the answering of different types of questions
• Different processes provide to different degrees of assurance and thoroughness

Requirement Processes

• Elicitation
  – How to ascertain requirements
  – Interviewing, classifying, organizing
  – Emphasis on perspectives/viewpoints
• Review
  – How to determine consistency, completeness, etc.
  – Emphasis on analysis
  – Need for semantic basis and inference reasoning
• Revision/Improvement/enhancement
  – How to add, delete, modify
  – Rereview: how to determine consistency of modified requirement specification

Being Precise about Requirements Processes

• Helps developers understand
  – Other stakeholders too
• Basis for automated support
• Being precise about processes is closely tied to being precise about artifacts

Example Requirement Specification Process

Define Rqmt Element

Definition of Define Rqmt Element

Better Definition of Define Rqmt Element
Define Rqmt Element

Better Definition of Define Rqmt Element

Many Details Left Out
Many Other Alternatives

- When to check what
- How to do the checks
- How to respond
  – And when
- Etc.
- Being more specific about process entails being
  more specific about artifacts/products

Focus on artifact specification approaches and issues

Evaluation of Requirements Specification Media

Example Specification Media:
- NATURAL LANGUAGE
- STRUCTURED NATURAL LANGUAGE
- DIAGRAMS/CHARTS
- FORMAL APPROACHES
- COMBINATIONS OF THE ABOVE
- LIFECYCLE UTILITY

Example Specification Media:
- NATURAL LANGUAGE
- STRUCTURED NATURAL LANGUAGE
- DIAGRAMS/CHARTS
- FORMAL APPROACHES
- COMBINATIONS OF THE ABOVE
- LIFECYCLE UTILITY

How Do They Match Up with Each other?
Natural Language Prose Requirements Specification

- Write requirements in "plain English"
- Build upon universal base of understanding of natural language
- Possible to augment with defined terms
- Use of punctuation for clarification
- Text and word processing systems help automate/maintain/alter

Examples:
- All input data sets will be terminated with an end of file record
- System will respond to service requests within 2 seconds
- System will have a friendly user interface
- System will never go into an infinite loop

Problem: How to reason about a natural language reqts. spec? How to determine: completeness, unambiguity, etc.?

Disciplined Use of Natural Language

- Natural response to problems of:
  - imprecision
  - ambiguity
  - consistency (especially when due to size)
- Familiar approaches:
  - Restricted use of defined terms
  - Introduction of structuring (paragraph numbering, outline form, templates, etc.)
- Other, earlier examples of disciplined use of natural language:
  - Legal documents
  - Recipes

Data Base Approaches

- Requirement items stored as database entries
- Queries to retrieve information
- Database tools to check for consistency

Examples:
- Use of structure and reserve words
  - User interaction functions;
    - **Timing:** All functions must execute in < 2 seconds
    - **Subfunctions:**
      - Query
      - Browse
      - Enter
  - Disciplined use of naming
    - **input_value:** pay_rate
    - **pay_rate:** input_to

Hierarchical Decomposition Organization

- Requirements Specification as hypertext
- Structure (DAG) of Requirements Elements
  - Child element represents part-of relation
  - Requirement Element is a record
  - Requirement Element fields carry information as:
    - Instances of preset types
    - Instances related to others by relations
      - express consistency rules
      - define consistency determination
      - define inconsistency remediation
    - Relations among
      - Requirement elements
      - Requirement elements and parts of other artifacts
        (e.g., testplan elements, other reqts. representations)
Example: Using this to specify requirements for a Multifunction Watch

- Watch functions include
  - Telling time
  - Alarms
  - Telephone directory
  - Appointment book
  - Memo pad
- With various additional constraints
  - Speed
  - Accuracy
  - Robustness
  - Etc.

Partial Formalization of Functional Decomposition Requirement Specification

A Requirements Specification, R, is a set

\[ R = \{ r \mid r \text{ is a requirement element} \} \]

\[ r, \text{ a requirement element, is a tuple,} \]

\[ r = (\text{children}(r), \text{parent}(r), \text{timing}(r), \text{functionality}(r), \text{robustness}(r), \text{inputs}(r), \text{outputs}(r) ) \]

ETC.

Physiology of a Requirement Element
Using this for Hierarchy Specification

children(r) = { s ∈ R | s is a subfunction of r }

Question: What do we mean by "subfunction"?
--Is included textually within
--Requires in order to execute properly
--...?

parent(r) = The s ∈ R such that r ∈ children(s)
ancestors(r) = the transitive closure of r under the parent relation
= r U parent(r) U parent(parent(r)) U ...

Timing Requirement Specification

timing(r) is a Boolean function

Intuition: To help clarify, define timing(r) to be the function pass(testresult), which maps the set of results of executing testcases for r onto the Boolean values (True, False)

Thus, pass. is a function that defines what it means for a testresult to "pass" (ie. to satisfy a timing constraint)

Examples: timing(datebook) ≡ testresult < 0.1 seconds
          ≡ testresult < 0.1 + size(datebook_cont)/1000

Note obvious proximity to testing concerns

Functionality Specification

functionality(r) = n, a node in a graph, G

Intuition: The functionality being specified here is being specified with the help of a graph, whose semantics provide rigor to the definition of the function being required.

The semantics of the graph will turn out to be vitally important in supporting reasoning about the requirements specification and its consistency with design specifications.

Using a DFD

functionality(r) = n, a node in the DFD, D = (N, E)

Intuition: The functionality being specified here is being specified with the help of a DFD.

Input/Output Specification

inputs(r) = { i | i is an object needed for the execution of the function denoted by n, the DFD node used to define the functionality of r }

outputs(r) = { o | o is an object created by the execution of the function denoted by n, the DFD node used to define the functionality of r }
An FSM can help too

• Use FSM to define how a (set of) function(s) must be related to others.
• Create an “Accessed By” field?
• Value is a pointer into FSM that describes the workings of the system

Each node (state) pointed to by the appropriate field in the appropriate node of the requirements definition

Children of these nodes point to these “substates”

Multirepresentation Systems

• Have seen that different representations are of different uses
• One diagram may be useful in different ways to different stakeholders
• But most stakeholders require a variety of diagrams
• Several different diagrams can be expected to be needed to satisfy the different stakeholders
• Problems with different views/diagrams
  – How do they all represent the same software product?

  – How do they all represent the same software product?
Robustness Specification

\[ \text{robustness}(r) \equiv \text{a first order logic implication} \]
\[ A_r \Rightarrow B_r \text{ such that whenever an execution of the functionality defined by } r \text{ "satisfies" the predicate } A_r, \text{ then it necessarily also "satisfies" the predicate } B_r. \]

Example:
\[ A_r: \text{The clock stops ticking} \]
\[ B_r: \text{The datebook keeps working} \]

Security Specification

- Who is allowed to use this function?
- Under what circumstances?
- With what restrictions?
- Etc.

Some Possible Relations Involving Such Nodes

This Diagram Suggested When to Check

---

Define Rqmt Element

Define Functional

Make Functional

Define Input/Output

Make Input/Output
Examples of what to check and how

**Internal Consistency:**
\[ \forall r \in R, s \in \text{children}(r) \Rightarrow \text{parent}(s) = r \]
\[ \forall r \in R, \forall \text{testresult}, \text{pass}(\text{testresult}) = True \Rightarrow \text{pass}(\text{testresult}) = True \]
\[ \forall s \in \text{descendant}(r) \]

**Interartifact Consistency:**
\[ \forall r \in R, i \in \text{inputs}(r) \Rightarrow i \text{ is an input to the node } n \text{ in the DFD that defines the functionality of } r \]

Examples of some checks performed after some steps in some requirements processes

Part of this feature of Process Definition

Checking Timing Requirements Against Design (a look ahead)

Showing consistency between a timing requirement, and timing characteristics of a design specification:

Suppose design is specified by a flowgraph; flowgraph is defined by means of the Immfol relation. Use Immfol to derive the Fol relation.

Suppose each flowgraph node is annotated with a timing specification. Suppose requirements node is defined by one or more flowgraph nodes.

Trace flowgraph paths to compute timing of function, and compare to requirement node timing spec.

Checking Timing Requirements

Other Requirements Structures

- Functional decomposition often works well as the structure of a requirements specification
  - Key feature: “all” requirements are clustered by function
- Other decompositions are sometimes better
- Goal decomposition is increasingly interesting
- vanLamsweerde’s KAOS system
  - Goals decomposed into subgoals
  - Special attention to robustness with scoped exception specification
Another One: Tokeneer

Security Decomposition

- Focus on who can do what
- Hard to infer that from the functional decomposition
- Makes most sense when security is the key focus of the system
- May make it harder to infer other things
  - Presumably they are less important

(Recall) Typical Stakeholders and their Needs

- Customer: needs to
  - communicate what the system must be like
  - have a basis for determining if it works right
- Developer: needs to
  - understand what the system must be like
  - what the design must implement
- Tester: needs to
  - know how to evaluate the final system
- User: needs to
  - see that real underlying needs are going to be met

Evaluate These Requirement Specification Approach Against Requirements Problems

- Incompleteness
- Inconsistency
- Ambiguity
- Infeasibility
- Unevenness
- There are others....

Requirements Incompleteness

- EXAMPLES: Missing requirements, missing details
- CAUSES
  - Customer may be unavailable, inaccessible, a group
  - Customer asks for too little
    - doesn't understand computer's capabilities
    - doesn't understand interfaces to larger system
  - Customer doesn't think of everything
    - desired function not mentioned
    - special case forgotten
  - The world changes, new things are required
- REMEDIAL APPROACHES
  - Cross checking requirements with each other
  - Facilitated by building in relations and redundancy

Requirements Inconsistency

- Many types of inconsistency: inconsistent wrt what?
  - Timing: function/subfunction mismatch
  - Functionality: subfunctions don't "flow right"
  - Robustness: no specification of error recovery
- CAUSES
  - Customer may be a group that disagrees
  - Different people may negotiate different parts
  - Early identification of inconsistency can be a big benefit
- REMEDIAL APPROACHES
  - "Cross-checking" related requirements elements’
    - What to check against what? How? For what?
Requirements Ambiguity

- More than one possible set of inferences
- **CAUSES**
  - Customer may be a group where no one sees the whole picture—until at least first
  - Difficult to spot ambiguity in large, complex applications
  - So many parts, related to each other in so many ways
- **REMEDIAL APPROACHES**
  - Materialize the relations
  - Use them to identify inconsistencies
- **PROBLEM:** How to control which inferences are possible, and which are not allowable?

Requirements Infeasibility

- **CAUSES**
  - Customer asks for too much
    - no conceivable algorithm
    - unrealistic requests
  - Still useful to know what ultimate desires are
    - Enables early expectation management
    - Suggests incremental development planning
- **REMEDIAL APPROACHES**
  - This is a very hard problem
  - Need to determine consistency of requirements specification with designs and implementations
    - Multiple notions of “consistency”

Requirements Unevenness

- **CAUSES**
  - Different sources of information
  - Different people write different parts
  - Different parts of specification are more difficult than others
- **REMEDIAL APPROACHES**
  - Relate details at different levels to other details at similar levels
